Quality Attributes:

- QA1: "Usability"

The system should be intuitive enough that new users can complete basic tasks within **2 minutes** without training. The interface must follow consistent **design patterns** and provide clear feedback. **Accessibility standard**s (WCAG 2.1) should be met to support users with disabilities.

- QA2: "Functional Suitability"

The system must produce accurate and complete results, such as correctly processing orders and calculating totals with **99% consistency**. All required features should be implemented and aligned with user needs. Edge cases must be handled correctly.

- QA3: "Scalability"

The system should support increasing loads, such as handling up to **1,000 concurrent users** without performance degradation. It must dynamically scale resources (e.g., via cloud infrastructure) to handle peak times like lunch/dinner rushes. Response times should remain **under 2 seconds** under normal and high load.

- QA4: "Cost Efficiency"

The system should minimize operational costs by optimizing resource usage. Infrastructure and maintenance costs must stay within a predefined monthly budget. Cost estimates for scaling or feature expansion should be **predictable and transparent.**

- QA5: "Compatibility"

The system must integrate smoothly with external systems using standard APIs. It should work across major devices and browsers (**mobile, tablet, desktop**). Data exchange formats (e.g., JSON, REST APIs) must follow industry standards to ensure interoperability.
